

# Acknowledgments

The thesis mainly provides two solutions: one focuses on the IEEE 802.11 Point Coordination Function (PCF), while the other improves the performance of 802.11e Enhanced Distributed Channel Access (EDCA). The latter work was supported in part of the Innovative and Prospective Technologies Project of the Institute of Information Industry. During the two years of my research, I appreciate all the instruction and guidance from my advisor, Professor Jyh-Cheng Chen. In addition, I would like to acknowledge the assistance from my laboratory members, Kai-Wen Tzeng and Jui-Hung Yeh. The work would hardly succeed without their help. Finally, I would like to thank for the spiritual support of my family even though I seldom went home because of the research project.
